Research question

How is generative AI assistance associated with university student creativity, and how do AI literacy and creative self-efficacy help explain that relationship?

End-to-end workflow

Survey design	Response screening	Measurement checks	PLS-SEM	Research paper

Methods

Online questionnaire conducted in July 2026 with university students in China. The analysis used SmartPLS 4, PLS-SEM, and 5,000-sample bootstrapping. Quality checks covered indicator reliability, internal consistency, convergent and discriminant validity, collinearity, and common method bias.

Analytical scope

Structural-model assessment covered direct and indirect (mediation) pathways and explanatory power. Model results are intentionally not shown in this public summary.

First-author contribution

Worked across questionnaire design, response screening, data preparation, measurement-model assessment, structural-model analysis, interpretation, visualization, and manuscript preparation.

Portfolio boundary	The camera-ready paper, full abstract, raw responses, item wording, model results, and acceptance letter are not included. The paper is accepted but is not represented here as already published or indexed.
