valid responses	measurement items	bootstrap samples	variance explained in creativity

Research question

How is generative AI assistance associated with university student creativity, and how do AI literacy and creative self-efficacy help explain that relationship?

End-to-end workflow

Survey design	Response screening	Measurement checks	PLS-SEM	Research paper

Methods

Online questionnaire conducted in July 2026 with university students in China. The analysis used SmartPLS 4, PLS-SEM, and 5,000-sample bootstrapping. Quality checks covered indicator reliability, internal consistency, convergent and discriminant validity, collinearity, common method bias, direct and indirect effects, and explained variance.

Selected results

Relationship	β	p
GenAI assistance -> Creativity	0.331	0.008
GenAI assistance -> Creative self-efficacy	0.485	<0.001
Creative self-efficacy -> Creativity	0.323	<0.001
GenAI assistance -> AI literacy	0.411	<0.001
AI literacy -> Creativity	0.236	<0.001

All six proposed direct relationships were supported. AI literacy and creative self-efficacy also formed complementary indirect pathways between GenAI assistance and creativity.

First-author contribution

Worked across questionnaire design, response screening, data preparation, measurement-model assessment, structural-model analysis, interpretation, visualization, and manuscript preparation.

Portfolio boundary	The camera-ready paper, full abstract, raw responses, item wording, complete output, and acceptance letter are not included. The paper is accepted but is not represented here as already published or indexed.
